

Grass Growth Regulator - Primo Maxx

Growth regulators work by re-directing plant growth as they specifically target the gibberellic acid site responsible for cell elongation in grass.

Not only do growth regulators inhibit vertical growth, they actually divert plant growth downwards into the root system to produce increased food reserves and healthy internal root and stem development. This in turn produces a thicker healthier sward that helps equip your turf to withstand temperature extremes, moisture loss and wear.

An application will work within 1-2 weeks. You may notice a slight yellowing of the grass when first applied but this is normal and should disappear after the first cut. Cut your grass as normal as clippings should start to reduce by up to 50% for up to 8 weeks.

Please ask your Greenkeeper if you have any further questions.
